CS162 Operating Systems and Systems Programming Lecture 1

What is an Operating System?

## August 26<sup>th</sup>, 2015 Prof. John Kubiatowicz http://cs162.eecs.Berkeley.edu

Acknowledgments: Lecture slides are from the Operating Systems course taught by John Kubiatowicz at Berkeley, with few minor updates/changes. When slides are obtained from other sources, a a reference will be noted on the bottom of that slide, in which case a full list of references is provided on the last slide.

## Greatest Artifact of Human Civilization...

3

2.8 B

<u>3 Billion Internet Users by</u>

## Operating Systems at the heart of it all ...

- Make the incredible advance in the underlying hardware available to a rapid evolving body of applications.
  - Processing, Communications, Storage, Interaction
- The key building blocks
  - Scheduling
  - Concurrency
  - Address spaces
  - Protection, Isolation, Security
  - Networking, distributed systems
  - Persistent storage, transactions, consistency, resilience
  - Interfaces to all devices

#### Number of apps in Apple App Store and Android Market [01/2010 – 12/2011E]

### Example: What's in a Search Query?

- Complex interaction of multiple components in multiple administrative domains
  - Systems, services, protocols, ...

- Some of you will actually design and build operating systems or components of them.
  - Perhaps more now than ever
- Many of you will create systems that utilize the core concepts in operating systems.
  - Whether you build software or hardware
  - The concepts and design patterns appear at many levels
- All of you will build applications, etc. that utilize operating systems
  - The better you understand their design and implementation, the better use you'll make of them.

- What is an Operating System?
  - And what is it not?
- Examples of Operating Systems design
- What makes Operating Systems So Exciting?
- Oh, and "How does this class operate?"

## Interactive is important! Ask Questions!

Slides courtesy of David Culler, John Kubiatowicz, AJ Shankar, George Necula, Alex Aiken, Eric Brewer, Ras Bodik, Ion Stoica, Doug Tygar, and David Wagner.

## What is an operating system?

- Special layer of software that provides application software access to hardware resources
  - Convenient abstraction of complex hardware devices
  - Protected access to shared resources
  - Security and authentication
  - Communication amongst logical entities

## Operator ...

**Computer Operators**

### **OS Basics: "Virtual Machine" Boundary**

## **Interfaces Provide Essential Boundaries**

- Why do interfaces look the way that they do?
  - History, Functionality, Stupidity, Bugs, Management
  - CE323  $\Rightarrow$  Machine interface
  - CE227  $\Rightarrow$  Human interface
  - CE418  $\Rightarrow$  Software engineering/management

### OS Basics: Program => Process

### 8/26/15

## **OS Basics: Context Switch**

### 8/26/15

### OS Basics: Scheduling, Protection

### 8/26/15

## OS Basics: I/O

### 8/26/15

## **OS Basics: Loading**

### 8/26/15

# What make Operating Systems exciting and Challenging

### Technology Trends: Moore's Law

1995 1975 1980 1985 1990 10M 500 (transistors) (mips) 2000 25 1M Pentium<sup>®</sup> Processor 80486 100K 1.0 80386 80286 10K 0.1 0.01

Gordon Moore (co-founder of Intel) predicted in 1965 that the transistor density of semiconductor chips would double roughly every 18 months. 2X transistors/Chip Every 1.5 years Called "Moore's Law"

Microprocessors have become smaller, denser, and more powerful.

### Microprocessor Transistor Counts 1971-2011 & Moore's Law

https://commons.wikimedia.org/wiki/File:Transistor\_Count\_and\_Moore%27s\_Law\_-\_2011.svg

## People-to-Computer Ratio Over Time

year

- Today: Multiple CPUs/person!
  - Approaching 100s?

8/26/15

## New Challenge: Slowdown in Joy's law of Performance

## ManyCore Chips: The future is here

- Intel 80-core multicore chip (Feb 2007)
  - 80 simple cores
  - Two FP-engines / core
  - Mesh-like network
  - 100 million transistors
  - 65nm feature size
- Intel Single-Chip Cloud
  Computer (August 2010)
  - 24 "tiles" with two cores/tile
  - 24-router mesh network
  - 4 DDR3 memory controllers
  - Hardware support for message-passing

- "ManyCore" refers to many processors/chip
  - 64? 128? Hard to say exact boundary
- How to program these?
  - Use 2 CPUs for video/audio
  - Use 1 for word processor, 1 for browser
  - 76 for virus checking???

## Another Challenge: Power Density

- Moore's Law Extrapolation
  - Potential power density reaching amazing levels!
- Flip side: Battery life very important

Storage Capacity

Year

## Retail hard disk capacity in GB

## Not Only PCs connected to the Internet

- Smartphone shipments now exceed PC shipments!
- 2011 shipments:
  - 487M smartphones
  - 414M PC clients
    - »210M notebooks
    - »112M desktops
    - »63M tablets
  - 25M smart TVs

• 4 billion phones in the world  $\rightarrow$  smartphone over next decade

## Syllabus

- OS Concepts: How to Navigate as a Systems Programmer!
  - Process, I/O, Networks and VM
- Concurrency
  - Threads, scheduling, locks, deadlock, scalability, fairness
- Address Space
  - Virtual memory, address translation, protection, sharing
- File Systems
  - i/o devices, file objects, storage, naming, caching, performance, paging, transactions, databases
- Distributed Systems (8)
  - Protocols, N-Tiers, RPC, NFS, DHTs, Consistency, Scalability, multicast

- Individual Homework (1-2 weeks): Learn Systems
  Programming
  - O. Tools, Autograding, recall C, executable
  - 1. Simple Shell
  - 2. Web server
  - 3. Memory Management
- Three Group Projects (Pintos in C)
  - 1. Threads & Scheduling
  - 2. User-programs
  - 3. File Systems

- Start homework 0 immediately
  - Github account
  - Vagrant virtualbox VM environment for the course » Consistent, managed environment on your machine
  - Get familiar with all the tools
- Waitlist ???
  - If you are not serious about taking the course, please drop the course now

Group Project Simulates Industrial Environment

- Project teams have 4 members (try really hard to get 4 members - 3 members requires serious justification)
  - Must work in groups in "the real world"
- Communicate with colleagues (team members)
  - Communication problems are natural
  - What have you done?
  - What answers you need from others?
  - You must document your work!!!
- Communicate with supervisor (TAs)
  - What is the team's plan?
  - What is each member's responsibility?
  - Short progress reports are required

- Design Documents: High-level description for a manager! 8/26/15 Kubiatowicz CS162 ©UCB Fall 2015 34

## Grading

- 15% Midterms
- 25% Final
- 25% Homework
- 40% Group HWs
- Group HWs grading
  - [10 pts] Initial design
  - [10 pts] Design review
  - [10 pts] Design document
  - [60 pts] Code (3 checkpoints)
  - [10 pts] Final design
- Submission via git push to release branch
- Regular git push so TA sees your progress

Explaining a concept to someone in another group Discussing algorithms/testing strategies with other groups Helping debug someone else's code (in another group) Searching online for generic algorithms (e.g., hash table)

Sharing code or test cases with another group Copying OR reading another group's code or test cases Copying OR reading online code or test cases from from prior years

We compare all project submissions against prior year submissions and online solutions and will take actions (described on the course overview page) against offenders

## What is an Operating System?

- · Referee
  - Manage sharing of resources, Protection, Isolation
    - » Resource allocation, isolation, communication
- Illusionist

- Provide clean, easy to use abstractions of physical resources
  - » Infinite memory, dedicated machine
  - » Higher level objects: files, users, messages
  - » Masking limitations, virtualization

- Common services
  - » Storage, Window system, Networking
  - » Sharing, Authorization
  - » Look and feel

- Applications consisting of...
  - ... a variety of software modules that ...
  - ... run on a variety of devices (machines) that
    - » ... implement different hardware architectures
    - » ... run competing applications
    - » ... fail in unexpected ways
    - » ... can be under a variety of attacks
- Not feasible to test software for all possible environments and combinations of components and devices
  - The question is not whether there are bugs but how serious are the bugs!

## A modern processor: SandyBridge

- Package: LGA 1155
  - 1155 pins
  - 95W design envelope
- Cache:
  - L1: 32K Inst, 32K Data (3 clock access)
  - L2: 256K (8 clock access)
  - Shared L3: 3MB 20MB

8/26/15 (not out yet)

- Transistor count:
  - 504 Million (2 cores, 3MB L3)
  - 2.27 Billion (8 cores, 20MB L3)
- Note that ring bus is on high metal layers – above the Shared L3 Cache

### Functionality comes with great complexity!

## Increasing Software Complexity

From MIT's 6.033 course

## Example: Some Mars Rover ("Pathfinder") Requirements

- Pathfinder hardware limitations/complexity:
  - 20Mhz processor, 128MB of DRAM, VxWorks OS
  - cameras, scientific instruments, batteries, solar panels, and locomotion equipment
  - Many independent processes work together
- Can't hit reset button very easily!
  - Must reboot itself if necessary
  - Must always be able to receive commands from Earth
- Individual Programs must not interfere
  - Suppose the MUT (Martian Universal Translator Module) buggy
  - Better not crash antenna positioning software!
- Further, all software may crash occasionally
  - Automatic restart with diagnostics sent to Earth
  - Periodic checkpoint of results saved?
- Certain functions time critical:
  - Need to stop before hitting something
  - Must track orbit of Earth for communication
- A lot of similarity with the Internet of Things?

- Complexity, QoS, Inaccessbility, Power limitations ... ? 8/26/15 Kubiatowicz CS162 ©UCB Fall 2015

## How do we tame complexity?

- Every piece of computer hardware different
  - Different CPU
    - » Pentium, PowerPC, ColdFire, ARM, MIPS
  - Different amounts of memory, disk, ...
  - Different types of devices
    - » Mice, Keyboards, Sensors, Cameras, Fingerprint readers
  - Different networking environment
    - » Cable, DSL, Wireless, Firewalls,...
- Questions:
  - Does the programmer need to write a single program that performs many independent activities?
  - Does every program have to be altered for every piece of hardware?
  - Does a faulty program crash everything?
  - Does every program have access to all hardware?

**OS Tool: Virtual Machine Abstraction** 

# Application

Virtual Machine Interface

# **Operating System**

Physical Machine Interface

## Hardware

- Software Engineering Problem:
  - Turn hardware/software quirks ⇒
    what programmers want/need
  - Optimize for convenience, utilization, security, reliability, etc...
- For Any OS area (e.g. file systems, virtual memory, networking, scheduling):
  - What's the hardware interface? (physical reality)
  - What's the application interface? (nicer abstraction)

- Software emulation of an abstract machine
  - Give programs illusion they own the machine
  - Make it look like hardware has features you want
- Two types of "Virtual Machine"s
  - Process VM: supports the execution of a single program;
    this functionality typically provided by OS
  - System VM: supports the execution of an entire OS and its applications (e.g., VMWare Fusion, Virtual box, Parallels

- Programming simplicity
  - Each process thinks it has all memory/CPU time
  - Each process thinks it owns all devices
  - Different devices appear to have same high level interface
  - Device interfaces more powerful than raw hardware

 $\gg$  Bitmapped display  $\Rightarrow$  windowing system

» Ethernet card  $\Rightarrow$  reliable, ordered, networking (TCP/IP)

- Fault Isolation
  - Processes unable to directly impact other processes
  - Bugs cannot crash whole machine
- Protection and Portability
  - Java interface safe and stable across many platforms

System Virtual Machines: Layers of OSs

- Useful for OS development
  - When OS crashes, restricted to one VM
  - Can aid testing programs on other OSs

8/26/15

What is an Operating System,... Really?

- Most Likely:
  - Memory Management
  - I/O Management
  - CPU Scheduling
  - Communications? (Does Email belong in OS?)
  - Multitasking/multiprogramming?
- What about?
  - File System?
  - Multimedia Support?
  - User Interface?
  - Internet Browser? 😔

- No universally accepted definition
- "Everything a vendor ships when you order an operating system" is good approximation
  - But varies wildly
- "The one program running at all times on the computer" is the kernel.
  - Everything else is either a system program (ships with the operating system) or an application program

- Operating systems provide a virtual machine abstraction to handle diverse hardware
- Operating systems coordinate resources and protect users from each other
- Operating systems simplify application development by providing standard services
- Operating systems can provide an array of fault containment, fault tolerance, and fault recovery
